

## 7. Capstone Project

The Computer Science curriculum consists of a series of courses. This section describes how the XYZ project reflected the skills and competencies gained from previous courses.

By definition, XYZ project, as a fulfillment of the requirements of the BS project course (CSIS290), is a capstone project which is a senior-level activity that allows the students to solve a substantial problem with knowledge gained from the areas of the field. It is required to define a problem, develop a solution, produce and demonstrate an artifact that solves the problem, and present the work.

A set of competencies was required to perform the tasks involved in completing the project. The following table represents the competencies and the corresponding courses that contributed to building these competencies.

Competency	Course
